

INSY8314 WEB DESIGN

Assignment Instructions:

1. Select one project topic from the provided list and develop a complete web application related to that topic using: HTML5, CSS3, JavaScript, PHP, MySQL, XAMPP.
2. The project report must be written by the student based on their own development work and understanding.
3. Reports generated entirely using Artificial Intelligence (AI) tools without the student's own contribution, analysis, and discussion will be considered invalid and will receive zero (0) marks.
4. Students must be able to explain and demonstrate their developed application during evaluation.

Project Requirements

1. Develop the Application

- Create a functional web system based on the selected topic.
- Implement relevant features such as user authentication, data entry, search, update, database storage, and reporting where applicable.

2. Design the Interface

- Create a professional and user-friendly interface.
- Add appropriate images, icons, colors, navigation menu, and responsive design.

3. Test the Application

- Test the system using different sample data.
- Demonstrate features such as adding records, searching, updating, validation, and report generation.

4. Prepare a PDF Report

The report should include:

- Project title, background, and objectives.
- Technologies and system features.
- Database design.
- Screenshots of the developed application.

- Testing process and results.
- Discussion of results, challenges, and possible improvements.
- Conclusion.

5. Submission

Submit:

- PDF project report with screenshots.
- Send the PDF report to: **Email:** ericbyiringiro25@gmail.com
- **Deadline:** Any date from Sunday to date before the Final Examination.

Topics:

1. Student Attendance Management System

Develop a web application that allows users to register and log in before recording student attendance. The system should allow users to add student attendance records, search students by registration number, update attendance records, generate attendance reports, and print the report.

2. Hospital Patient Record Management System

Develop a web application that enables hospital staff to manage patient records. The application should include user authentication, patient registration, recording patient consultation details, searching patients by patient ID or phone number, updating patient records, and printing patient medical reports.

3. Hotel Room Reservation System

Develop a web application for managing hotel room reservations. The system should allow staff to log in, register customers, make room reservations, search for reservations using the customer's phone number or booking ID, update reservation details, calculate the total accommodation cost, and print reservation invoices.

4. Library Book Borrowing Management System

Develop a web application that allows librarians to manage book borrowing activities. Users should log in before recording book loans. The system should record borrower details, search borrowing records by student registration number, update return dates, display borrowed books, and print borrowing reports.

5. School Fee Payment Management System

Develop a web application that enables users to record student fee payments. The application should include login and registration pages, record payment details, search payments using the

student's registration number, update payment records, calculate the total fees paid, and print payment receipts.

6. Pharmacy Sales Management System

Develop a web application for recording medicine sales. The system should allow users to log in, record customer purchases, search sales using the customer's phone number, update sales records, calculate the total bill, and print sales invoices.

7. Employee Payroll Management System

Develop a web application that enables users to manage employee salary records. The application should allow employee registration, salary recording, searching employees by employee ID, updating salary information, calculating net salary, and printing payroll reports.

8. Vehicle Service Management System

Develop a web application for a vehicle garage to manage customer service records. The system should allow staff to record customer and vehicle information, services performed, service charges, search records by vehicle registration number, update service information, and print service invoices.

9. Inventory and Stock Management System

Develop a web application for managing product inventory. The application should enable users to record products, search products by product code, update stock quantities, calculate stock value, and print inventory reports.

10. Electricity Bill Management System

Develop a web application that records customer electricity usage and billing information. The system should allow users to register customers, record monthly meter readings, calculate electricity bills, search customers by meter number, update records, and print customer bills.
